

Guidelines and Requirements for electronicPhytosanitary Certificates

Use of this Document

IPPC refers to a “Phytosanitary certificate” for export purposes and a “Phytosanitary certificate for re-export” for re-export purposes. In order to keep the use of these terms simple and clear in this document, the term “Phytosanitary certificates” (plural) is used to cover both types of certificates. When information is specific to either type of certificate, the appropriate abbreviation will be used (PC or PC/R).

Introduction

This document provides guidance for mapping **electronic phytosanitary certificates based on UN/CEFACT schema version17 of the SPSCertificate (package 17A)**. The underlying principle is that electronic phytosanitary certificatescontain the same elements as paper phytosanitary certificates as described in ISPM 12 (2014). Therefore the elements of ISPM 12 are the basis and are in the table in the first column. The aim of this mapping is to standardize the structure of electronic phytosanitary certificates thereby facilitating worldwide exchange of electronic certificates.

Structure of tables

An ePhyto is divided into two main elements: The SPS Exchange Document Element (DOC) and the SPS Consignment element (COT), with a corresponding table for each.

The first table represents the SPS Exchange Document Element and is formatted as follows:

Document Level (DOC)	ISPM12 element	Element subdivision in ISPM12	Schema Tag	Example	Printable Example	Schema element notes	Format
The element to be described	The specific field from ISPM12	Any divisions within that field	The tag where the information will be placed.	XML example of the entire element	Recommended display on a printed certificate	Description and extra information	IT specific guidelines for parameters related to that element.

The second table represents the SPS Consignment Element and its internal levels, these are SPS Consignment Item level (EPT) and Trade Line Item level (QPT) and is formatted as follows:

Consignment Level (COT)	Consignment Item Level (EPT)	Trade Line Item Level (QPT)	ISPM12 element	Element subdivision in ISPM 12	Schema Tag	Example	Printable Example	Schema element notes	Format
			The specific field from ISPM12	Any divisions within that field	The tag where the information will be placed.	XML example of the entire element	Recommended display on a printed certificate	Description and extra information	IT specific guidelines for parameters related to that element.

In the table SPS Consignment, the first three columns indicates the element to be described (at different levels), then the information represented in the table has the same structure than the previous one.

Levels of information

The document level contains information on the type of document and the consignment level contains information relevant for the whole of the consignment. The export product level contains information that is applicable to the product. The consignment may consist of several or only one product and a product may consist of one or more plant species or plant product. For instance the product can be roses or it can be a Bouquet consisting of roses and tulips. The quarantine product level contains information on the plant or plant product, this is normally the level for which phytosanitary requirements are in place.

In the mapping the information at export product level is indicated as a so called consignment item and the information on a quarantine product will be indicated as a so called trade line item. One consignment can contain more than one consignment item and each consignment item can contain more than one trade line item. If a consignment consists of only one product which consists of only one quarantine product, the detailed information on the quarantine product will also be on the QPT level. In this way the plant health status of each of the quarantine products in relation to the additional declarations, treatments and reference to other documents (i.e. re-export certificates and import permits) can be indicated separately. A consignment can therefore consist of more than one consignment item and of more than one trade line item.

Information elements at the DOC and COT level occur only once in the map because they are as such applicable to the whole of the consignment. Information elements at the EPT and the QPT level can occur more than once depending on the number of different products in the consignment.

Simple consignment / mixed consignment / mixed product

A simple consignment consists of only one export product which consists of only one quarantine product, e.g. a consignment only containing roses from one country. A mixed consignment consists of different export products and these export products consist each of them of only one quarantine product, e.g. a consignment containing apples and pears in separate boxes. A mixed product is an export product that consists of more than one quarantine product, e.g. Bouquet consisting of roses and tulips. Of course more combinations are possible, but these are the major compositions of consignments to be covered. These different compositions will result in different structures of the mapping; this is illustrated below for a simple consignment, a mixed consignment and a mixed product.

**Note: The acronyms used in the field tags within the document are described in the annex below**

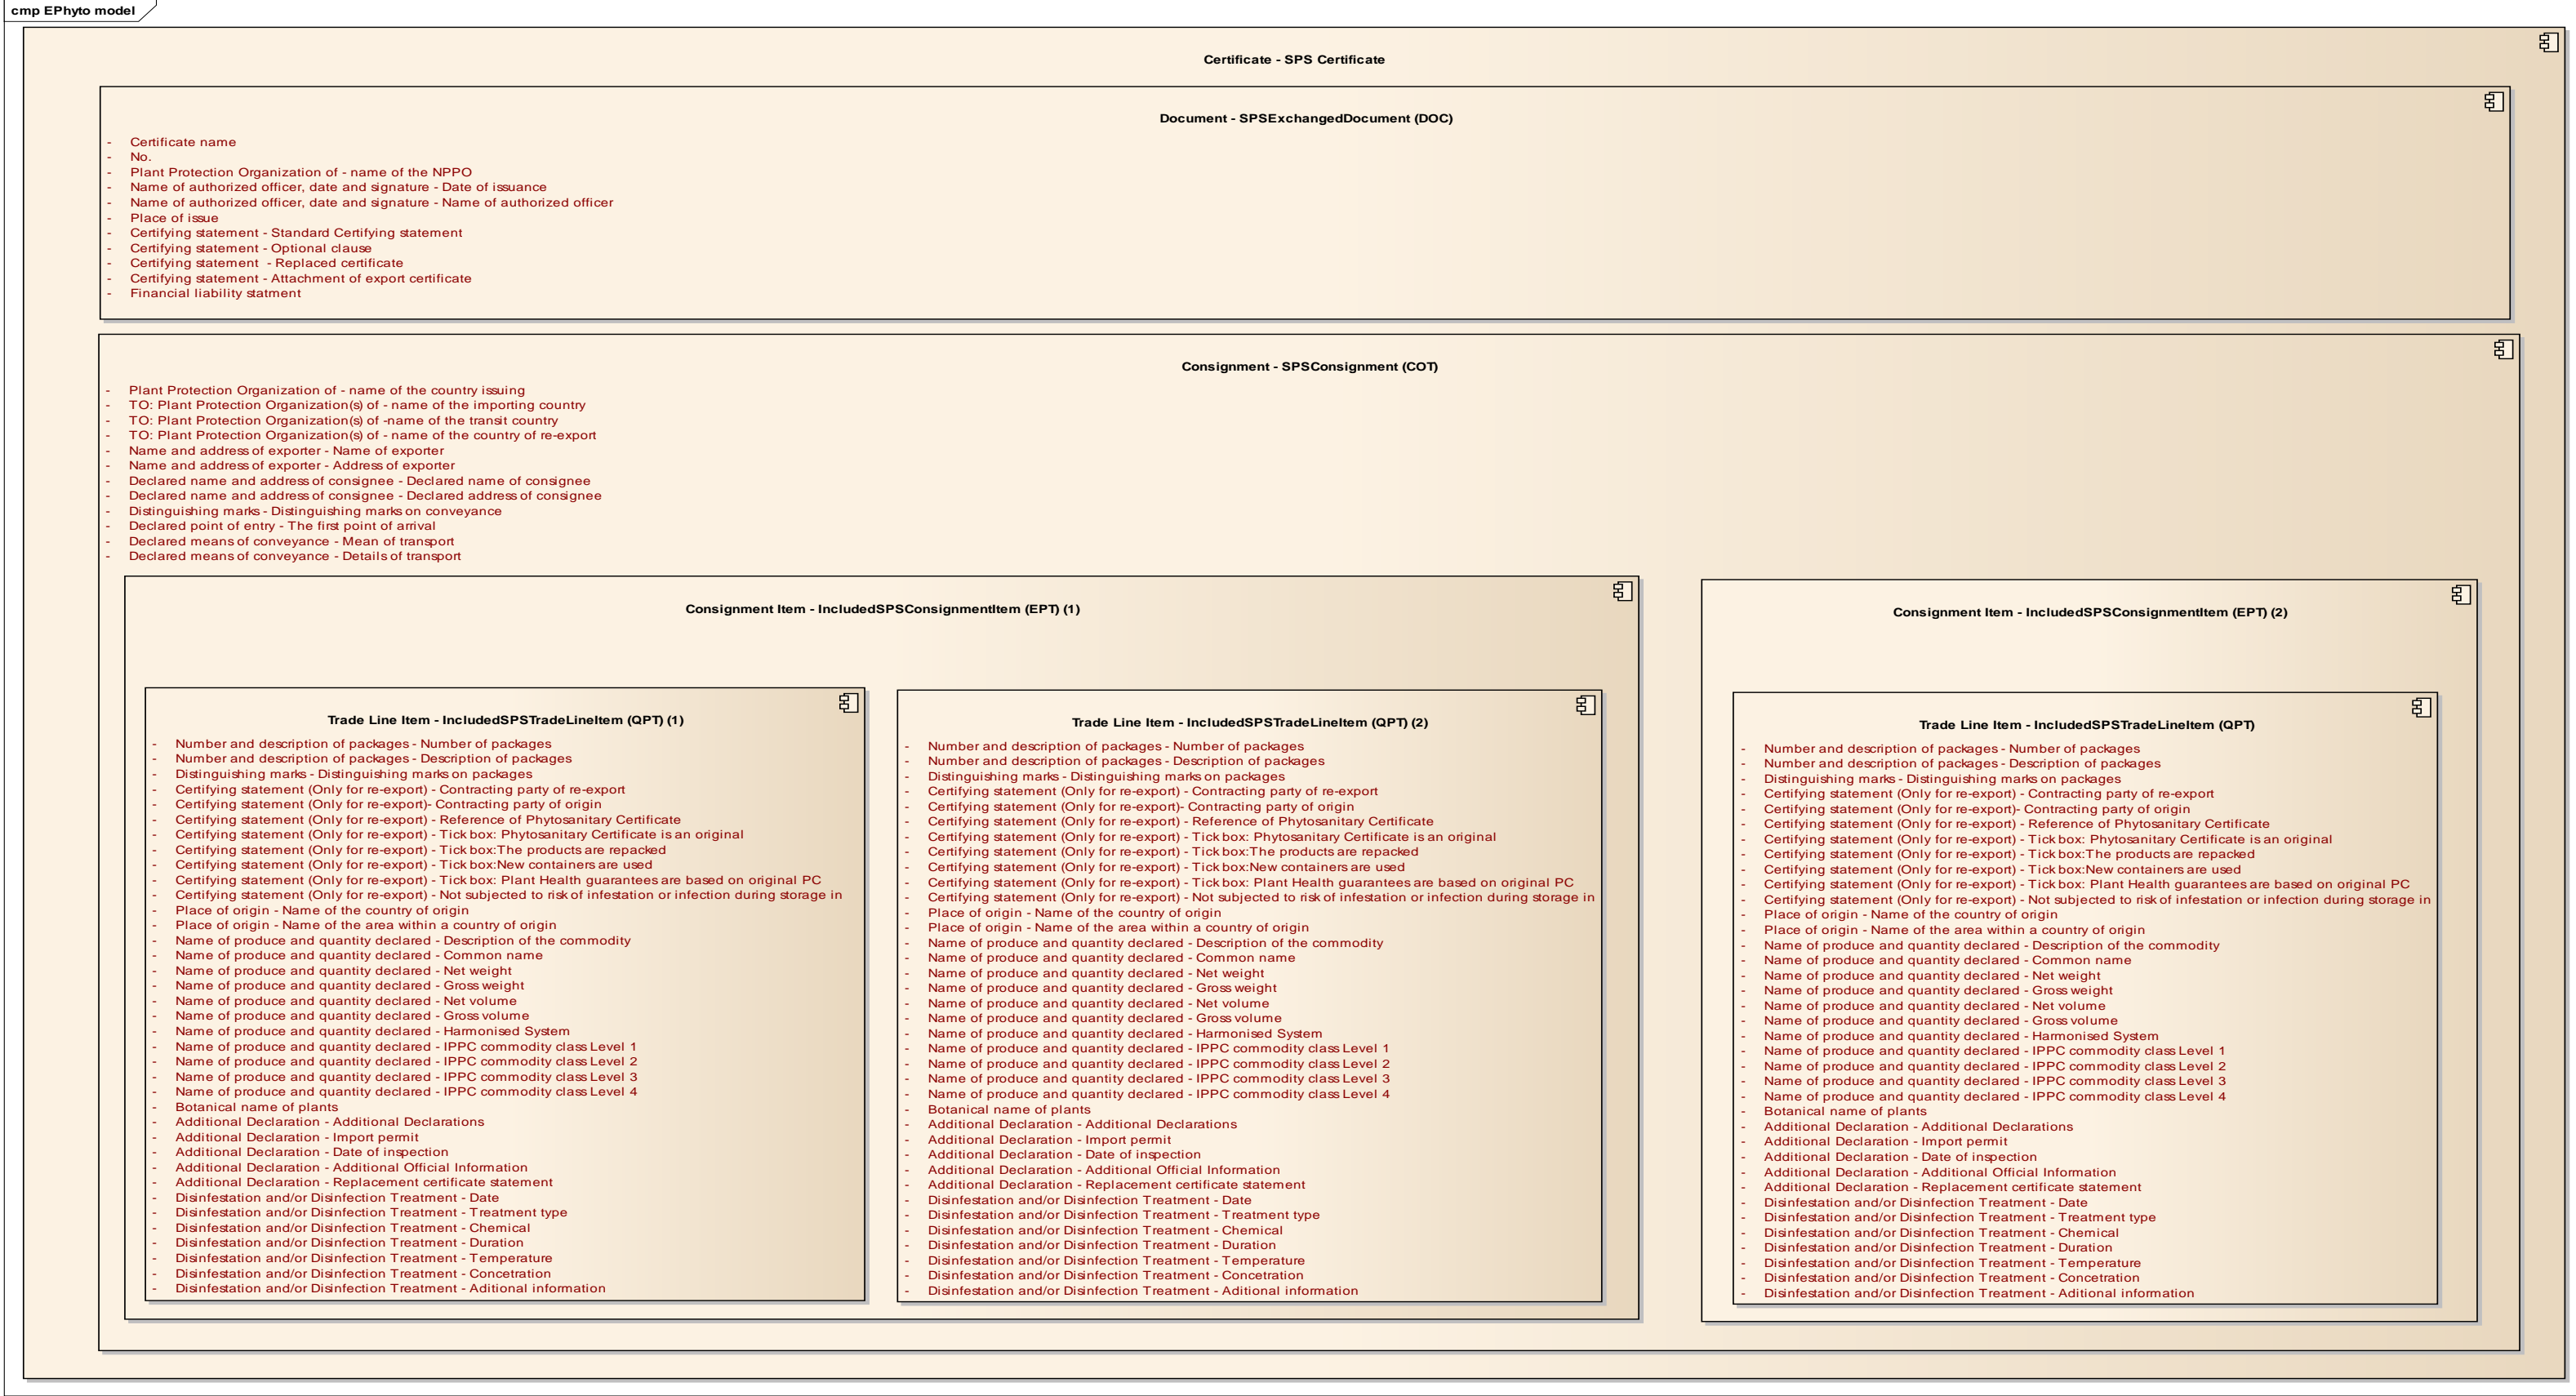

Figure1: structure of the mapping
